|                   |                          |                     |                     |

Candidates answer on the Question Paper.

No Additional Materials are required.

## **READ THESE INSTRUCTIONS FIRST**

Write your Centre number, candidate number and name on all the work you hand in.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

DO NOT WRITE IN ANY BARCODES.

Answer all questions.

Electronic calculators may be used.

You may lose marks if you do not show your working or if you do not use appropriate units.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [ ] at the end of each question or part question.

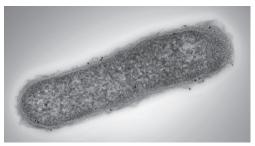

## Answer **all** the questions.

1 A diagram of a chromosome from a dividing cell is shown in Fig. 1.1.

|     | Fig. 1.1  |
|-----|---|
| (a) | A dividing cell is at risk of losing genetic material each time DNA replication occurs.   |
|     | On Fig. 1.1, add a label line and the letter <b>G</b> to show the location on the chromosome of an area that helps to prevent the loss of genes. [1]  |
| (b) | The chromosome shown in Fig. 1.1 consists of one long DNA molecule associated with histone proteins.  |
|     | Name <b>one</b> stage of mitosis in which a chromosome would have the same general structure as the chromosome shown in Fig. 1.1.   |
|     | [1]   |
| (c) | Name the stage in the mitotic cell cycle during which the cytoplasm and the cell divide to produce two genetically identical daughter cells.  |
|     | [1]   |
| (d) | The control of the cell cycle can be affected by extracellular chemical messengers that bind to proteins and glycoproteins in the cell surface membrane. The overall mechanism is known as cell signalling. |
|     | State the term used to describe the proteins and glycoproteins that function in this way.   |
|     | [1]   |
|     | [Total: 4]  |

- 2 The infectious disease cholera is caused by a bacterium.
  - (a) Fig. 2.1 shows a transmission electron micrograph of this bacterium.

 $\times 30000$ 

Fig. 2.1

| (i)  | Nar | ne the bacterium that causes cholera.  |
|------|-----|--|
|      |     | [1]  |
| (ii) | The | bacterium in Fig. 2.1 is an example of a prokaryotic cell.   |
|      |     | ch of the descriptions <b>A</b> to <b>C</b> describes a cell structure found in prokaryotic cells <b>and</b> lant cells.                           |
|      | For | each of the descriptions A to C:   |
|      |     | <ul> <li>name the cell structure described</li> <li>state one difference in this structure between a prokaryotic cell and a plant cell.</li> </ul> |
|      | A   | the site of polypeptide synthesis  |
|      |     | cell structure   |
|      |     | difference   |
|      |     |  |
|      | В   | the genetic material of the cell   |
|      |     | cell structure   |
|      |     | difference   |
|      |     |  |
|      | С   | the structure that provides a rigid shape to the cell and prevents osmotic lysis   |
|      |     | cell structure   |
|      |     | difference   |
|      |     |  |

[6]

| (b)        | Cholera is an example of       | f an infectious disease.  |                  |
|------------|--------------------------------|---|------------------|
|            | Explain what is meant b        | y an infectious disease.  |                  |
|            |                                |   |                  |
|            |                                |   |                  |
|            |                                |   |                  |
|            |                                |   | [2]              |
| The        | e symptoms of cholera are      | e caused by choleragen, a toxin released by the bac   | terium.          |
| Cho        | oleragen is a protein mad      | e up of six polypeptides:   |                  |
|            | helix                          | oolypeptide known as the A subunit that includes an at together make the B subunit.   | n extended alpha |
| <b>T</b> . |                                | •   | 0144             |
| inte:      | estinal epithelial cell. The o | binds to a cell surface membrane component, know<br>complete choleragen protein then enters the cell by e<br>of the protein acts as an enzyme, disrupting the nor | ndocytosis. Once |
| (c)        | List the levels of protein     | structure present in choleragen.  |                  |
|            |                                |   |                  |
|            |                                |   | [2]              |
| (d)        | Outline the mechanism          | by which choleragen enters the cell.  |                  |
|            | You may use the space          | for annotated diagrams.   |                  |
|            |                                |   |                  |
|            |                                |   |                  |
|            |                                |   |                  |

**3** Catalase is an enzyme that catalyses the breakdown of hydrogen peroxide, a toxic waste product of metabolism.

$$2H_2O_2 \longrightarrow 2H_2O + O_2$$

Fig. 3.1 shows the results of an investigation into the effect of hydrogen peroxide concentration on the rate of the catalase-controlled reaction, with and without the presence of two different inhibitors.

hydrogen peroxide concentration/mmoldm<sup>-3</sup>

Fig. 3.1

(a) The inhibitors used in the investigation have different modes of action.

Identify which of curves X, Y and Z are the results for:

- the reaction with the non-competitive inhibitor
- the reaction with the competitive inhibitor
- the reaction without any inhibitor.

| non-competitive inhibitor |  |
|---------------------------|--|
| competitive inhibitor     |  |
| without any inhibitor     |  |

- 6 (a) A student investigated the effect of changing the surface area to volume ratio on diffusion.
  - Two different-sized blocks of agar, X and Y, were made.
  - The agar contained Universal Indicator solution.
  - Universal Indicator solution changes colour when acid is added.
  - The blocks were placed in dilute hydrochloric acid at the same temperature.
  - The student timed how long it took for each block to change colour completely.

Blocks X and Y are shown in Fig. 6.1. All dimensions are in cm.

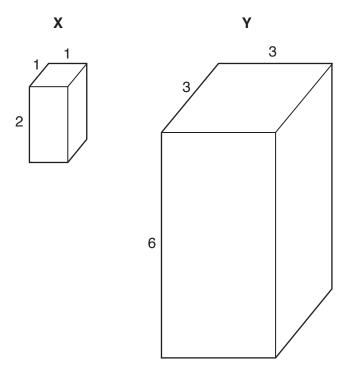

Fig. 6.1

(i) The surface area to volume ratio of block **X** is 5:1.

Calculate the surface area to volume ratio of block Y.

Show your working.
